

Metro Ticket Booking Digitization

Requirement Analysis Phase

1. Customer Journey Map

This document maps the end-to-end experience of a metro commuter booking a ticket through the digitized ServiceNow platform. It traces each touchpoint from initial discovery to post-journey feedback, highlighting user actions, emotional response, pain points in the current manual/paper-based process, and the opportunities the digital solution creates at every stage.

Figure 1.1 — End-to-end commuter journey across the digitized ticketing system

1. Discovery

Persona Involved	Passenger
User Action	Commuter learns about the digital booking option via station signage, the metro mobile app, or the ServiceNow-powered self-service portal link shared by station staff.
Emotional Response	Curious, slightly unsure of a new process
Current Pain Point (Manual Process)	No visibility of a fast digital alternative to physical counters; long queues at peak hours.
Digital Opportunity (ServiceNow)	In-app banner, portal landing page, and WhatsApp entry point make the digital option immediately visible.

2. Login / Access Portal

Persona Involved	Passenger
User Action	Commuter accesses the Service Portal (web/mobile) or WhatsApp bot and authenticates using mobile number/OTP or a guest checkout flow.

Emotional Response	Neutral to positive if login is quick
Current Pain Point (Manual Process)	Manual counters require cash and physical presence; no account history or reusable profile.
Digital Opportunity (ServiceNow)	Single sign-on style OTP login built on the Service Portal reduces friction to under 30 seconds.

3. Select Station & Travel Details

Persona Involved	Passenger
User Action	Commuter fills the Service Catalog item, choosing Source station, Destination station, Passenger Type (General/Student/Senior Citizen), and Number of Tickets.
Emotional Response	Focused, expects clarity and speed
Current Pain Point (Manual Process)	Manual ticket windows depend on verbal communication and paper maps; errors in station names are common.
Digital Opportunity (ServiceNow)	Catalog client scripts and station reference data auto-validate routes and prevent invalid combinations.

4. Fare Review

Persona Involved	Passenger
User Action	System instantly computes the fare using distance/zone-based logic and passenger category discounts, and displays a clear fare breakup before payment.
Emotional Response	Reassured by transparency
Current Pain Point (Manual Process)	Fare disputes at manual counters due to unclear calculation or human error.
Digital Opportunity (ServiceNow)	Automated Fare Logic script guarantees consistent, auditable, error-free pricing.

5. Payment

Persona Involved	Passenger
User Action	Commuter completes payment via UPI, debit/credit card, or mobile wallet integrated through the Flow Designer payment sub-flow.
Emotional Response	Confident, values cashless convenience
Current Pain Point (Manual Process)	Cash-only counters slow throughput and create change-related delays.
Digital Opportunity (ServiceNow)	Multiple digital payment rails increase adoption and speed up transaction completion.

6. QR Ticket Generated

Persona Involved	Passenger
User Action	On successful payment, the Flow Designer workflow instantly generates a digital ticket with a unique QR code, delivered in-app and via notification.
Emotional Response	Delighted by instant fulfillment
Current Pain Point (Manual Process)	Paper tickets can be lost, damaged, or forgotten; reprints require another queue.
Digital Opportunity (ServiceNow)	QR ticket is stored digitally, always retrievable, and requires zero paper.

7. Travel & Gate Validation

Persona Involved	Passenger, Station Manager
User Action	Commuter scans the QR code at the Automated Fare Collection (AFC) gate; the Station Manager's console reflects real-time validation status.
Emotional Response	Smooth, fast entry builds trust
Current Pain Point (Manual Process)	Manual ticket checking at gates is slow and prone to disputes over validity.
Digital Opportunity (ServiceNow)	Instant QR validation reduces gate dwell time and gives station managers real-time visibility.

8. Feedback / History

Persona Involved	Passenger, Metro Operations Team
User Action	Commuter can view booking history, raise a support ticket for issues, or submit feedback; Metro Operations reviews aggregated usage analytics.
Emotional Response	Satisfied; feels heard
Current Pain Point (Manual Process)	No structured channel exists today to capture commuter feedback or travel history.
Digital Opportunity (ServiceNow)	Digital trail enables data-driven decisions on route optimization and peak-time planning.

Key Takeaways

- The journey shrinks from a multi-step manual process (queue, cash payment, paper ticket, manual gate check) to a self-service digital flow completed in under two minutes.
- Every stage after login is instrumented, giving Metro Operations end-to-end visibility that does not exist in the current paper-ticket system.
- Emotional friction is highest at legacy touchpoints (queueing, cash handling, disputed fares) — all of which are directly addressed by the automated fare logic and QR-based validation.
- Station Managers and IT Admins are journey stakeholders too: the former for real-time gate validation, the latter for platform configuration and support.
